Attempt : 1

Total Mark : 10

Marks Obtained : 10

Section 1 : Coding

1. Problem statement:

Tim was tasked with developing a grocery shopping app. You have a class hierarchy that includes Item, Produce, and OrganicProduce. Your goal is to calculate the total cost of a shopping list, which may contain a mix of regular produce and organic produce items. Additionally, you need to apply discounts to organic items. Apply a 10% discount on organic produce items

Class Hierarchy:

Item: Base class for all items.

Produce: Subclass of Item for regular produce items.

OrganicProduce: Subclass of Produce for organic produce items.

Input Format

The first line of input consists of an integer, 'n'.

For each 'n' item, the user will provide:

- A string 'type' representing the item type ('Regular' or 'Organic').
- A string 'name' represents the item name.
- A double 'price' represents the item price.

Output Format

The output will display the total cost of the shopping list, including discounts on organic items.

Refer to the sample output for format specifications.

Sample Test Case

Input: 1

Regular Banana 1.99

Output: 1.99

Answer

```
import java.util.Scanner;  
// You are using Java  
class Item {  
    protected String name;  
    protected double price;  
  
    public Item(String name, double price) {  
        this.name = name;  
        this.price = price;  
    }  
  
    public double calculateCost() {  
        return price;  
    }  
}
```

```
241501174 class Produce extends Item {  
241501174     public Produce(String name, double price) {  
241501174         super(name, price);  
241501174     }  
241501174  
241501174     @Override  
241501174     public double calculateCost() {  
241501174         return price; // regular produce has no discount  
241501174     }  
241501174 }
```

```
241501174 class OrganicProduce extends Produce {  
241501174     public OrganicProduce(String name, double price) {  
241501174         super(name, price);  
241501174     }  
241501174  
241501174     @Override  
241501174     public double calculateCost() {  
241501174         return price * 0.9; // apply 10% discount  
241501174     }  
241501174 }
```

```
241501174 public class Main {  
241501174     public static void main(String[] args) {  
241501174         Scanner sc = new Scanner(System.in);  
241501174  
241501174         int n = sc.nextInt();  
241501174         sc.nextLine(); // Consume newline  
241501174  
241501174         double totalCost = 0.0;  
241501174  
241501174         for (int i = 0; i < n; i++) {  
241501174             String type = sc.next();  
241501174             String name = sc.next();  
241501174             double price = sc.nextDouble();  
241501174  
241501174             if (type.equals("Regular")) {  
241501174                 Item item = new Produce(name, price);  
241501174                 totalCost += item.calculateCost();  
241501174             } else if (type.equals("Organic")) {  
241501174                 Item item = new OrganicProduce(name, price);  
241501174                 totalCost += item.calculateCost();  
241501174             }  
241501174         }  
241501174     }
```

```
        }  
    }  
    System.out.printf("%.2f%n", totalCost);  
}
```

Status : Correct
